

PPS One Quality Management

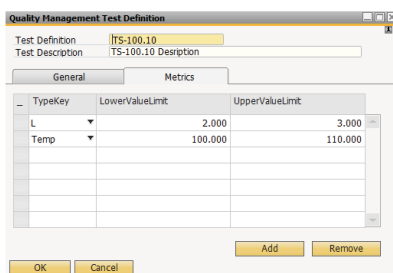

With the definition of the test definitions, test parameters and the Non Conforming Material Reports, the PPS One Quality Management module is ready for the future of keeping your quality at a high level with the ease of use as you are used to in the standard PPS One functions.

Your inspectors can view the upcoming test easily and perform the inspections with just a mouse-click. Keep track of your defects, product specifications and inspection-instructions in a very user-friendly way. Integrated into the strong manufacturing functionality of PPS One, you can leverage all the functionality that SAP Business One and PPS One have to offer.

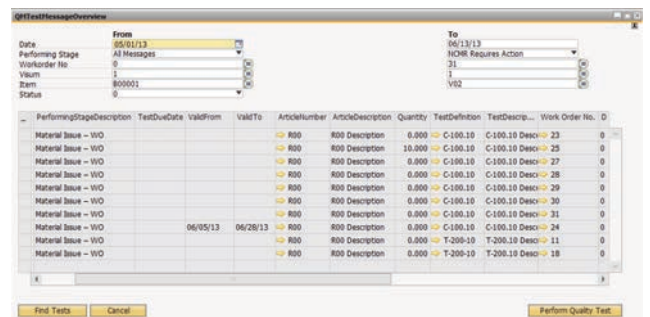

The Quality Control module handles defect tracking from Material Issue Production through the manufacturing process for products. QC codes and QC metrics are defined and activated on a by-item/by-resource list basis from Material issue to production, production labour processing, production receipts and goods receipt purchase order.

Messages are generated and monitored by the user. They can be processed and tracked in the system, which will result in capturing defect tracking information, test management, non-conforming material reports (NCMR) and quality control analysis reporting.

Unique QC Codes and Descriptions are entered in the QC Code window that will be used when problems occur in the manufacturing cycle, from vendors to manufacturing final goods inspections.

Inspectors can see their own inspections to be made in an easy to use overview.

Several reports are available in the module:

- Inspection overview
- Test result overview
- Defect overview
- Non Conforming Material Report (NCMR)
